

QA Testing Report – Personal Portfolio Website

Overview

This document summarizes manual QA testing performed on my personal React portfolio website. The focus was on navigation, responsiveness, and usability across desktop and mobile layouts.

Test Environment

- Browser: Chrome (latest)
 - Device: Desktop + Mobile view (responsive mode)
 - Framework: React (Vite)
 - Deployment: Vercel
-

Test Cases

TC1 – Navigation Scroll Behavior

Steps:

- Click navbar links (About, Projects, Contact)

Expected Result:

- Page scrolls to correct section
- Section heading is fully visible

Actual Result:

- Sections navigated correctly
- Headings were initially slightly hidden under navbar

Status: Fixed

Fix Applied:

- Added `scroll-padding-top` to adjust offset for sticky navbar
-

TC2 – Responsive Layout (Mobile)

Steps:

- Resize screen to mobile width
- Inspect project and skill sections

Expected Result:

- Cards stack vertically

- No horizontal overflow

Actual Result:

- Layout adjusted correctly after CSS update
- Minor spacing issues initially

Status: Fixed

TC3 – UI Interactions

Steps:

- Hover over buttons (Email, Resume, Project links)

Expected Result:

- Hover states visible and consistent

Actual Result:

- Hover effects worked as intended

Status: Pass

Issues Found

Issue	Severity	Status
Navbar overlap hiding headings	Medium	Fixed
Tight spacing on mobile grid	Low	Fixed
Inconsistent section spacing	Low	Fixed

Fixes Applied

- Added `scroll-padding-top` for navigation alignment
 - Adjusted grid layout for responsive stacking
 - Improved spacing consistency between sections
-

What I Learned

This testing process showed how small layout and CSS issues can significantly impact usability. It reinforced the importance of testing responsiveness and navigation behavior during development, not only after completion.

Conclusion

The website is now fully functional with improved navigation behavior and responsive layout. All identified issues were resolved through CSS adjustments and iterative testing.
